ComputeX MATHEMATICS & COMPUTING

MODELKRAFT

Visionary Event by ComputeX

This event challenges participants to apply machine learning to real-world data by building predictive models for a given target variable. Through hands-on work in preprocessing, feature engineering, model selection, and optimization, participants sharpen their technical and problem-solving skills. Models are evaluated on a hidden test set to ensure fairness and true generalization, fostering critical thinking, creativity, and practical expertise in data-driven decision-making.

INSTRUCTIONS:

- Open to all students
- Team participation only (2-3 members per team)
- Participants must write code live during the event.
- Participants must use PYTHON programming language only.
- Participants can use TensorFlow or Pytorch.
- Participants must use the desktops provided by the organizers

Models will be tested on a hidden subset using predefined metrics (e.g., accuracy, F1). In case of a tie, the lighter model will be declared the winner.

Competitive yet collaborative environment that encourages both innovation and teamwork.
